# Networking Fundamentals: IP, DNS, URL, MIME

Computer Science and Engineering ■ College of Engineering ■ The Ohio State University

Lecture 11

- □ A unique 32-bit number
  - Assigned to device connected to internet
  - An address for delivery of packets
- Written in "dotted-decimal" notation
  - Divided into 4 fields separated by "."
- □ Some are reserved: eg, 127.0.0.1

#### Abstract Value vs Encoding

- □ Abstraction: 32-bit integer value
- Encodings
  - Dotted decimal
  - Dotted hex
  - Dotted octal
  - Hexadecimal
  - Decimal
  - Binary
  - Etc...
- □ Recall: abstraction, representation, correspondence relation

#### Address Space

- Organizations are allocated blocks of contiguous address to use
- □ 32 bits means 4 billion addresses
  - Population of the earth: 7 billion
  - Not enough addresses to go around!
- □ The end is predictable
  - Techniques like NAT developed to help
- □ In fact, the end has come!
  - Feb 2011: Last block was allocated

- □ 128 bits
  - $\sim 10^{40}$  addresses; we're good for a while
  - A growing fraction of IP traffic
     GoogleIPv6 statistics
- Recommended format (canonical):
  - Divide into 8 fields separated by ":"
  - Each field is 4 hex digits (0-FFFF), ie 16 bits
  - Omit leading 0's in a field
  - If there are consecutive fields with value 0, compress them as "::"
  - Compress at most one such set of 0's
    - □ Otherwise encoding could be ambiguous
    - Compress the longest sequence

## Canonical Format: Uniqueness

**Computer Science and Engineering** ■ The Ohio State University

```
2001:0db8:0000:0000:0000:ff00:0042:8329
```

2001:0db8:0000:0000:0000:ff00:0042:8329

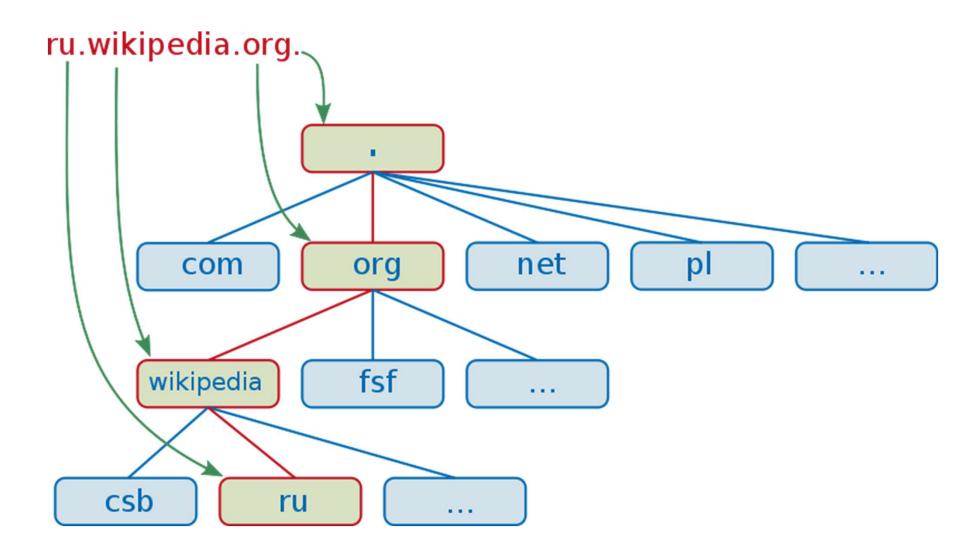

```
2001:db8:0:0:0:ff00:42:8329
```

2001:db8:0:0:0:ff00:42:8329

2001:db8::ff00:42:8329

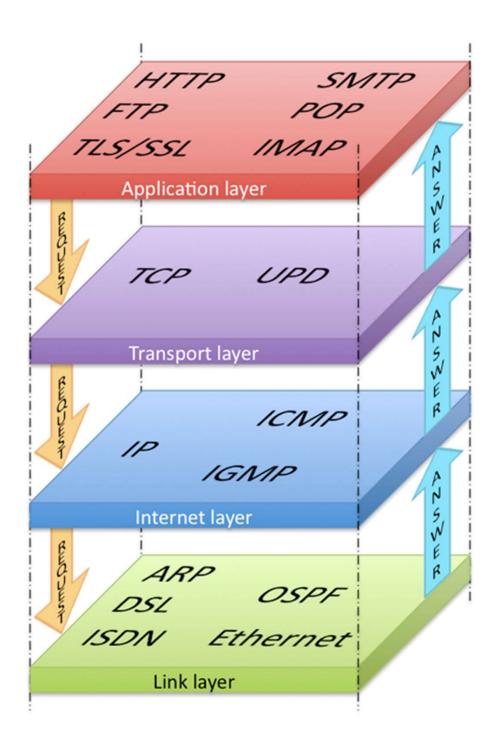

- String corresponds to an IP address
  - web.cse.ohio-state.edu is easier than 164.107.123.6
- Case insensitive: Lower-case standard
- □ A partial map (almost)
  - DNS maps lower-case strings → IP addresses
  - Multiple strings can map to same address!
  - Some strings map to multiple addresses (unusual)!

- □ Separated by .'s
  - Don't confuse with dotted decimal!
- □ Right-to-left hierarchy
  - Top-level domain is right-most field
     edu, com, net, gov, countries (ca, it, ...)
  - Second-level domain to its left
  - Then third, fourth, etc, no limit www.sos.state.oh.us
- □ Hostname + Domain Name = Fully Qualified Domain Name (FQDN) stdlinux.cse.ohio-state.edu

- Act as a phonebook for lookup
- Client view:
  - Given a FQDN, return IP address
  - Partial map: FQDNs → IP addresses
  - See host, whois
- Implementation view:
  - Hierarchical by domain
  - Local caching for recently retrieved items

- Systematic ordering of messages
  - Phone rings
  - Callee answers by saying "Hello"
  - Caller answers by saying "Hello"
- Different protocols use different messages, different sequencing, etc
  - In Italy, callee answers by saying "Pronto"

#### Network Layering: Abstraction

- One protocol is built on top of another
  - Application level: FTP, HTTP, SSH, SMTP, TELNET
  - Transport: TPC, UDP
  - Internet: IP
- Each protocol assumes certain behavior from layer below
  - IP routes packets to destination (unreliable)
  - TCP creates a reliable, in-order channel
  - HTTP delivers web pages

- A single host has many ports
- Application-level protocols have default port
  - ftp -> 20
  - http -> 80
  - imap ->143
  - ssh -> 22
  - smtp -> 25
  - telnet-> 23
- A "web server" is just a program, running, waiting, listening for a call (on port 80)
  - See telnet

- Uniform Resource Locator
  scheme://FQDN:port/path?query#fragment
- □ Schemes include http, ftp, mailto, file...
  - Case insensitive, but prefer lower case
- □ Port is optional (each scheme has default)
  - 80 for http
- □ Variety of formats, depending on scheme http://www.osu.edu/news/index.php ftp://doe@ftp.cse.ohio-state.edu mailto://brutus.1@osu.edu
- FQDN is case insensitive, prefer lower case

- □ Web server configured to serve documents from a location in file system
  - "document root": /class/3901
  - File: /class/3901/labs/lab2.html
  - URL: http://www.cse.osu.edu/labs/lab2.html
- □ Slashes in path should be for server's OS (but forward slashes are common)
- □ Virtual servers: multiple doc roots
- Proxy servers: remote doc roots

- Concrete invariant (convention)
  - No space, ;, :, & in encoding
  - To represent these characters in abstract value, use %hh instead (hh is ASCII code in hex)
    - □ %20 for space
  - Q: What about % in abstract value?
- □ Recall: correspondence relation
- Known as "URL encoding", or "percent encoding"

# **URL** Encoding

**Computer Science and Engineering** ■ The Ohio State University

#### Reserved characters after percent-encoding

1	#	\$	&	•	(	)	*	+	3	1	:	;	=	5	@	1	]
%21	%23	%24	%26	%27	%28	%29	%2A	%2B	%2C	%2F	%3A	%3B	%3D	%3F	%40	%5B	%5D

#### Common characters after percent-encoding (ASCII or UTF-8 based)

newline	space	•	%	-		<	>	1	^			{	1	}	~
%0A or %0D	%20	%22	%25	%2D	%2E	%3C	%3E	%5C	%5E	%5F	%60	%7B	%7C	%7D	%7E
or %0D%0A	1020	1022	/025	/oZU	/0ZE	/03C	/03E	/65C	/05E	/0DF	/600	/0/ D	/6/C	/o/D	/0/E

- Multipurpose Internet Mail Extensions
  - Used to be for mail attachments
- Content Type: How to interpret a file
  - File is a blob of bits (encoding)
  - How to map this blob into (abstract) value? Colors, sounds, characters, etc?
  - Recall: correspondence relation
- □ Syntax: type/subtype
  - text/plain, text/html, text/css, text/javascript
  - image/gif, image/png, image/jpeg
  - video/mpeg, video/quicktime
- □ Transfer encoding: A *layered* encoding
  - quoted-printable, base64

#### Example: Multiple Parts

Computer Science and Engineering ■ The Ohio State University

MIME-Version: 1.0 Content-Type: multipart/mixed; boundary=aFrontierString This is a message with multiple parts in MIME format. --aFrontierString Content-Type: text/plain This is the body of the message. --aFrontierString Content-Type: application/octet-stream

Content-Transfer-Encoding: base64

PGh0bWw+CiAqPGh1YWQ+CiAqPC9oZWFkPqoqIDxib2R5PqoqICAqPHA +VGhpcyBpcyB0aGUq

Ym9keSBvZiB0aGUqbWVzc2FnZS48L3A+CiAqPC9ib2R5Pqo8L2h0bWw +Cq==

--aFrontierString--

#### Example: Content Type

```
MIME-Version: 1.0
Content-Type: multipart/mixed; boundary=aFrontierString
This is a message with multiple parts in MIME format.
--aFrontierString
Content-Type: text/plain
This is the body of the message.
--aFrontierString
Content-Type: application/octet-stream
Content-Transfer-Encoding: base64
PGh0bWw+CiAqPGh1YWQ+CiAqPC9oZWFkPqoqIDxib2R5PqoqICAqPHA
+VGhpcyBpcyB0aGUq
Ym9keSBvZiB0aGUqbWVzc2FnZS48L3A+CiAqPC9ib2R5Pqo8L2h0bWw
+Cq==
--aFrontierString--
```

## Example: Transfer Encoding

**Computer Science and Engineering** ■ The Ohio State University

MIME-Version: 1.0

Content-Type: multipart/mixed; boundary=aFrontierString

This is a message with multiple parts in MIME format.

--aFrontierString

Content-Type: text/plain

This is the body of the message.

--aFrontierString

Content-Type: application/octet-stream

Content-Transfer-Encoding: base64

PGh0bWw+CiAgPGh1YWQ+CiAgPC9oZWFkPgogIDxib2R5PgogICAgPHA+VGhpcyBpcyB0aGUg

Ym9keSBvZiB0aGUgbWVzc2FnZS48L3A+CiAgPC9ib2R5Pgo8L2h0bWw+Cg==

--aFrontierString--

## Layered Encoding

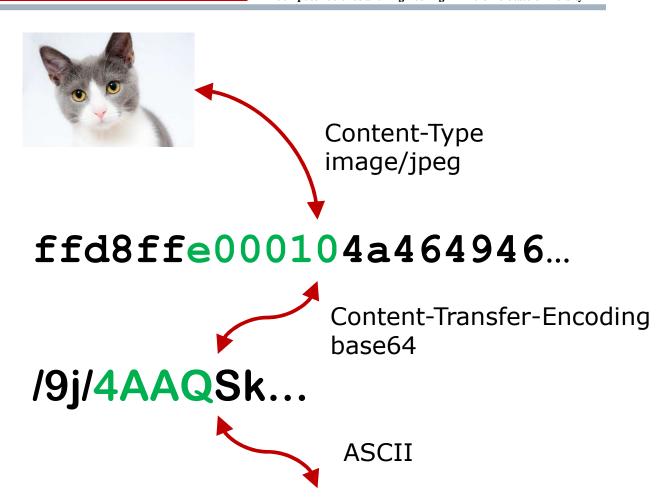

**Computer Science and Engineering** ■ The Ohio State University

source (image)

content (bits)

encoded (alphabet)

transmission (bits)

2f396a2f344141536b...

# Base64 Alphabet

**Computer Science and Engineering** ■ The Ohio State University

Value	Char	Value	Char	Value	Char	Value	Char
0	А	16	Q	32	g	48	W
1	В	17	R	33	h	49	x
2	С	18	S	34	i	50	у
3	D	19	Т	35	j	51	Z
4	Е	20	U	36	k	52	0
5	F	21	V	37	1	53	1
6	G	22	W	38	m	54	2
7	Н	23	х	39	n	55	3
8	I	24	Υ	40	0	56	4
9	J	25	Z	41	р	57	5
10	К	26	а	42	q	58	6
11	L	27	b	43	r	59	7
12	М	28	с	44	s	60	8
13	N	29	d	45	t	61	9
14	0	30	e	46	u	62	+
15	Р	31	f	47	v	63	1

en.wikipedia.org/wiki/Base64

# Base64 Encoding

source ASCII (if <128) M									a									n							
source octets		77 (0x4d)								97 (0x61)							110 (0x6e)								
Bit pattern	0	1	0	0	1	1	0	1	0	1	1	0	0	0	0	1	0	1	3	0	1	1	Ħ	0	
Index			1	9	M-H		22						5						46						
Base64-encoded	e64-encoded T				w						F						U								
encoded octets 84 (0x54)							87 (0x57)						70 (0x46)						117 (0x75)						

Text content	M																								
ASCII	77 (0x4d)								0 (0x00)									0 (0x00)							
Bit pattern	0	1	0	0	1	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Index			1	9					1	6					(	)					0				
Base64-encoded				Г					(	2			=						=						

- Alternative to base64 for making any binary data "printable"
  - Binary data uses all 8 bits
  - ASCII data uses only 7 (first bit is 0)
- Mapping each byte (just a sketch)
  - If first bit is already 0, do nothing
  - If first bit is 1, replace with 3 bytes: "=XY" where XY is the hex value being encoded
- □ Limit line length to 76 characters
- □ Finish lines with "="
- □ Q: What if data contains the byte "="?

#### **Computer Science and Engineering** ■ The Ohio State University

#### Example

J'interdis aux marchands de vanter trop leur marchandises. Car ils se font vite pédagogues et t'enseignent comme but ce qui n'est par essence qu'un moyen, et te trompant ainsi sur la route à suivre les voilà bientôt qui te dégradent, car si leur musique est vulgaire ils te fabriquent pour te la vendre une âme vulgaire.

J'interdis aux marchands de vanter trop leur marchandises. Car ils se font = vite p=C3=A9d agogues et t'enseignent comme but ce qui n'est par essence qu'= un moyen, et te trompant ainsi sur la route =C3=A0 suivre les voil=C3=A0 bi= ent=C3=B4t qui te d=C3=A9gradent, car si leur musique est vulgaire ils te f= abriquent pour te la vendre une =C3=A2me vulgaire.

#### Determining MIME Content Type

- □ The sender (web server) determines MIME (content) type of document being sent
  - Rules map file extensions to MIME types
- □ If file arrives without MIME info, receiver has to guess (see file command)
  - File extension may help
  - Contents may help: magic number at start
    - □ JPG: ff d8…
    - □ PDF: 25 50 44 46... (ie %PDF)
    - □ PNG: 89 50 4e 47 0d 0a 1a 0a... (ie .PNG...)
- Some types handled by browser itself
- Others require plugin or application
- Experimental MIME subtypes: x
  - application/x-gzip

- □ IP address are unique on network
  - IPv4 vs IPv6
- DNS maps strings to IP addresses
  - Domains nested hierarchically
- URLs identify resources on network
  - Scheme, host, path
- MIME type defines a file's encoding
  - Correspondence
  - Layered encodings are possible too
